

I'm not a robot

Hi, so I was working on a game and used the 'timer' block in more than one script. Both scripts are within the same sprite, and both have a 'reset timer' block at the end. And I noticed the longer timer doesn't do anything because the smaller timer gets reset before it. So I was wondering if there was an inbuilt way to have separate timers or if I'd just have to build my own? Thanks in advance. You can do this to make multiple timers:set [var V] to (current [time in milliseconds]V)This resets the timer.Then you can use this to get the timer value:((current [time in milliseconds V]) - (var)/(1000))This is a technique that uses multiple variables. Does this help? may also make a timers library if you want: Snap! Build Your Own Blocks Hi, I'm looking at what you have shown me and I see that I'd have to make my own separate timers. But I don't quite understand those 2 code blocks you have thereWhich one? The blocks I've embedded on the post? Or the blocks in the link? nein-ein:those 2 code blocks you have there OOPdemo: (drag the picture into the snap editor) sathvikrias:OOPWhat? Create a variable, then say:Repeat every 1 secondincrease timer by 1It's very inaccurate, the "repeat every one second" uses wall blocks that have a small delay. In a 60 frame rate, waiting till 60 actually took 61 seconds.And it does not support decimals. You can see my upper post for an accurate one. object-oriented programming' that's what my example uses, a long time ago, I used this in a projectid who made these blocks... (similar to @sathvikrias...) It took my awhile but I think I understand what I was struggling to. Current time in milliseconds is like 534 or 725 etc etc. Which is why it need to be divided by 1000, to turn it into seconds. Thank you all for your help, I think I can take it from here! very nice! This is SICP-style dispatch-procedure OOP using closures. Note that since last fall with OOP 2.0 you can now also model objects in a more prototypical, data-centric way using the OOP library: jensy:very nice!thanks! jens:since last fall you can now also model objects in a more prototypical, data-centric way using the OOP library,oh yeah, I forgot about that, but that's a really good example there, maybe something good for bh to add to the manual when it gets updated.is there any advantage to doing this one way or another? (is one faster?) if not, what was the reasoning behind adding OOP 2.0? louchemana:long time ago, I used this in a project(sorry, I have updated the link) here's an optimized version using modern blocks and more logic: It lacks the pause option, also you need to move the timer forward or backward to get a real one. "stop" is an option that should work the same as pause. Oh my goodness why is it so complicated to make another timer !!! I depends on what you want the timer mechanism to offer. If all you want is to (1) start / reset the timer and (2) read the elapsed time, its going to be really simple, e.g. if, on the other hand, you would like to be also able to (3) pause and resume, (4) add or subtract time while the timer is running, use (5) lap times vs. total time, perhaps even (6) make a period of time count double of something - that would be more complicated of course. This is a list of the most useful tips in the Snap! editor in case you don't know. This is a wiki post, you can edit this post, but:Rules for editingAdd a tip or some useful information that can help.Do not be rude.It must be a tip, don't add some trash stuff.You should not edit the text above "Tips".Follow the above rules. Editing this post without following the rules may have a risk of being reverted.Tipstip you may edit this part and below!1 - Previous costumeDo not use switch to costume (costume #) - (1) block and instead use switch to costume (1) - (1) to avoid the costume from suddenly switching to a turtle.2 - Debug your codeThe button below can be used to slow down scripts to debug your code. This is very useful to check errors. This is known as visible stepping. To enter this mode, click and the button will turn blue and add a slider. This slider can be used to control the speed of your program. As you run your program, you can see it progress based upon which block or input is highlighted.This can be useful for determining where in your code an error occurred. Note that visible stepping does not work within warp blocks. Other helpful parts of visible stepping include:Single Stepping: When you slide the speed slider all the way down to the bottom, you enter single stepping mode. The pause button is replaced with the single step button. This allows you to move forward through your code one step at a time.Debug Variable Scope: When visible stepping is on, one can visually see a variable's scope and where it is defined based upon blue highlighting.Reporting as you go: Reporters will show speech balloons to help you know what they are reporting and understand strange behaviours.3 - Random decimal between integers(pick random (1) to (10))If both inputs are integers without decimal points, the return value is an integer.(pick random (1.1) to (10))If you want a random decimal between two integers, put a decimal point after either (or both) integers.(pick random (1.2) to (3.4))You can also get a random decimal between two decimals.Want to add more tips? You can edit this wiki post! Follow the rules! Fen 6044: "hex sha512 hash" block is hidden in dev mode. But in fact, you can get it without going to dev mode. To enable, press the gear at the top-left then enable "Extension blocks".going to dev mode is faster than pressing a setting, scrolling all the way down, and looking through that abnormally large extension menu, and then typing hex sha512 hash rather than selecting it from a dropdown. I would suggest removing that... sathvikrias:going to dev mode is faster than pressing a setting, scrolling all the way down, and looking through that abnormally large extension menu, and then typing hex sha512 hash rather than selecting it from a dropdown. I would suggest removing that...done. Now what do you want to add? (this is a wiki post, so anyone can edit my post) Fen 6044:Do not use switch to costume (costume #) - (1) block and instead use switch to costume (1) - (1) to avoid the costume from suddenly switching to a turtle.2 - Debug your codeThe button below can be used to slow down scripts to debug your code. This is very useful to check errors. This is known as visible stepping. To enter this mode, click and the button will turn blue and add a slider. V10.4 has been releasedFloating point precision random numbers - pick a random float by entering an integer with a decimal point into at least one of the "pick random" reporter's input slots "Creating Art & Music" is an introductory course designed to introduce creative activities in the context of art and music. Thus far the course has been taught at the middle school, high school, community college, and university level (with appropriate adaptations for each level). Each week this list, students in the course are posting their projects in this strand of the Snap! forum. Here is a link to the course materials:Art, Animations & Music In this week's module, we will begin exploring how to create complex, multi-scene games. We will develop concepts, create rough drafts, and then refine mechanics and graphics. As a jumping off point, please review the documents on the course page for the module on Designing Games. This includes links to several games of varying complexity as well as text documents showing how they were built. The games included are:Slide ScrollersSimonPongBattleShipPacmanFeel free to review past versions of this module or other projects published in Snap! for additional game ideas. Once everyone has outlined a game they want to create and described the elements they want to include, we'll work on creating those elements and assembling them into a fully functioning game. The concept of my game will be similar to Doodle Jump. So, it'll essentially be a 2D platformer where players have to jump up to certain platforms to progress. Here are some of the mechanics I hope to implement in the game:Points systemMovement (moving left and right)Scrolling background (vertical)Collision detection with platformsAuto-Jump systemIn the original game, there is no win condition, however players try to get as many points as possible. The losing condition will be when the player falls off the platform/map and dies. I think that the most challenging parts of this will be generating the right amount random platforms and controlling the scrolling of the game. I haven't created any sample code yet, but I saw some examples from others similar to this game I hope to expand on. For my final project, I want to continue focusing on creating music. My goal is to create close to a 1 minute song that has a drum track, a main melody, and a harmony. I want to push myself in creating rhythms with different instruments that complement each other nicely. Some potential areas of difficulty I predict include timing my different tracks so that they play simultaneously and also setting realistic expectations for what I am able to create with my code. I want to use some of my code lines from Week 8, but am going to use a different melody track because the timing started to become wonky after adding the saxophone melody line last week. The game concept that I have in mind includes a similar concept to that of Donkey Kong, but a little different. The plan is to assign the player 3 "lives" that get decremented any time they run into an enemy obstacle while trying to reach the "top" of the game (win condition). The game also will include a rising lava pool that will ensnare # - (1) block and instead use switch to costume (1) - (1) to avoid the costume from suddenly switching to a turtle.Huh? I don't understand the alleged problem or solution.the most useful tips I think this might be a bit of an overreach. --) My all-time favorite tip would be shift-clicking an arrowhead to move a certain amount left or right to make approaching a ladder harder, and also a way to decrement "lives" every time an enemy is touched. The scoring system will mainly just be keeping track of "lives" and the win condition will be reaching the top marked by another sprite like a flag. A player loses once all three lives are depleted or if they touch the lava at any point during the game. I predict that some difficulty will arise when trying to implement the ladder portion of the game and creating code that allows for upward movement only when a player is in contact with a ladder. My game idea was a sort of top-down survival game, & the gist of its gameplay would be fending off procedurally-generated enemies which home on the player's location. There will be a score/exp tracker, and crossing a threshold will grant the player permanent buffs, such as a heal, more damage, larger area-of-effect, movement speed, or an extra life. Here is the project link (it will continue to be updated).Mechanics:Top-down, omnidirectional movementA means of attackingBuff + level up systemNo win condition defined yet; loss condition defined as losing all livesPotential difficulties:Procedural generation of enemies + removal of defeated enemies My final project idea was to create a song but in the lieu of the class going into video games I think I want to create something that is more upbeat and that could be categorized as either a battle theme or a victory theme or sorts. Regardless of the idea, it is meant to serve as game music. It is not in collaboration with anybody specifically but I will be taking inspiration from video game OSTs such as the final fantasy victory themes or Pokemon battle themes. I expect to either create some sort of full orchestral piece with brass, woodwinds, and strings or I may make my life simpler by focusing on one instrument as my main focus with other supporting instruments.My biggest difficulty I foresee is being able to create a catchy 'jingle' like melody if the purpose would be to have it loop at least ~2-3 in a single stage or battle. snap.berkeley.edu For my final project I want to create a game that is similar to mario, so the player can move left, right, and jump, and there will be a scrolling screen. It will be a platformer and in order to win, the player will have to cross the finish line at the end. I will use my sprites from the animation assignment and the player will have an attack ability. They player will start with three lives and there will be enemies within the game that can harm the player. If the player loses all three lives before reaching the end, they will lose. I hope to implement two different kinds of enemies. One type that is stationary (like platforms that can harm the player if they land on it) and more active/moving enemies. I imagine adding moving enemies will be the most difficult part of this idea. For my final project, I want to create a side-scrolling game where they have to avoid objects. The player will have the ability to move up and down using their mouse to avoid objects. They will get three chances (lives) in case they run into an object. Once all the lives are lost, the game ends. I want my game to be similar to "Flappy Bird" where a bird (the sprite) avoids the green pipes but instead of using the space bar to jump, the player uses their mouse.I think my most difficult part will be implementing the three lives and the addition of new objects from the side scrolling. For my game, I want to make a Guitar Hero-type game. If syncing exactly to music turns out to be too difficult, I could also do something similar to Dance-Dance Revolution, which would have a little more allowance for being out of sync. I need to implement the signals appearing on the screen, and either scrolling sideways or falling down. I also need to make it so that the player can press a button and it will activate as the signal crosses it. For scoring, to simplify it I will probably just either do hit (player presses correct button when the signal is within a certain range) or miss (player doesn't press the button, or presses the wrong button). I think syncing up the signals with the player button presses might be difficult, as well as syncing music and playing notes if I decide to go with the Guitar-Hero game. snap.berkeley.edu For my game I want to make materials:Art, Animations & Music In this week's module, we will begin exploring how to create complex, multi-scene games. I want my game to be similar to "Flappy Bird" where a bird (the sprite) avoids the green pipes but instead of using the space bar to jump, the player uses their mouse.I think my most difficult part will be implementing the three lives and the addition of new objects from the side scrolling. For my game, I want to make a Guitar Hero-type game. If syncing exactly to music turns out to be too difficult, I could also do something similar to Dance-Dance Revolution, which would have a little more allowance for being out of sync. I need to implement the signals appearing on the screen, and either scrolling sideways or falling down. I also need to make it so that the player can press a button and it will activate as the signal crosses it. For scoring, to simplify it I will probably just either do hit (player presses correct button when the signal is within a certain range) or miss (player doesn't press the button, or presses the wrong button). I think syncing up the signals with the player button presses might be difficult, as well as syncing music and playing notes if I decide to go with the Guitar-Hero game. snap.berkeley.edu For my game I want to make materials:Art, Animations & Music In this week's module, we will begin exploring how to create complex, multi-scene games. We will develop concepts, create rough drafts, and then refine mechanics and graphics. As a jumping off point, please review the documents on the course page for the module on Designing Games. This includes links to several games of varying complexity as well as text documents showing how they were built. The games included are:Slide ScrollersSimonPongBattleShipPacmanFeel free to review past versions of this module or other projects published in Snap! for additional game ideas. Once everyone has outlined a game they want to create and described the elements they want to include, we'll work on creating those elements and assembling them into a fully functioning game. The concept of my game will be similar to Doodle Jump. So, it'll essentially be a 2D platformer where players have to jump up to certain platforms to progress. Here are some of the mechanics I hope to implement in the game:Points systemMovement (moving left and right)Scrolling background (vertical)Collision detection with platformsAuto-Jump systemIn the original game, there is no win condition, however players try to get as many points as possible. The losing condition will be when the player falls off the platform/map and dies. I think that the most challenging parts of this will be generating the right amount random platforms and controlling the scrolling of the game. I haven't created any sample code yet, but I saw some examples from others similar to this game I hope to expand on. For my final project, I want to continue focusing on creating music. My goal is to create close to a 1 minute song that has a drum track, a main melody, and a harmony. I want to push myself in creating rhythms with different instruments that complement each other nicely. Some potential areas of difficulty I predict include timing my different tracks so that they play simultaneously and also setting realistic expectations for what I am able to create with my code. I want to use some of my code lines from Week 8, but am going to use a different melody track because the timing started to become wonky after adding the saxophone melody line last week. The game concept that I have in mind includes a similar concept to that of Donkey Kong, but a little different. The plan is to assign the player 3 "lives" that get decremented any time they run into an enemy obstacle while trying to reach the "top" of the game (win condition). The game also will include a rising lava stage, a way to implement upward movement based on a ladder sprite, enemies automated to move a certain amount left or right to make approaching a ladder harder, and also a way to decrement "lives" every time an enemy is touched. The scoring system will mainly just be keeping track of "lives" and the win condition will be reaching the top marked by another sprite like a flag. A player loses once all three lives are depleted or if they touch the lava at any point during the game. I predict that some difficulty will arise when trying to implement the ladder portion of the game and creating code that allows for upward movement only when a player is in contact with a ladder. My game idea was a sort of top-down survival game, & the gist of its gameplay would be fending off procedurally-generated enemies which home on the player's location. There will be a score/exp tracker, and crossing a threshold will grant the player permanent buffs, such as a heal, more damage, larger area-of-effect, movement speed, or an extra life. Here is the project link (it will continue to be updated).Mechanics:Top-down, omnidirectional movementA means of attackingBuff + level up systemNo win condition defined yet; loss condition defined as losing all livesPotential difficulties:Procedural generation of enemies + removal of defeated enemies My final project idea was to create a song but in the lieu of the class going into video games I think I want to create something that is more upbeat and that could be categorized as either a battle theme or a victory theme or sorts. Regardless of the idea, it is meant to serve as game music. It is not in collaboration with anybody specifically but I will be taking inspiration from video game OSTs such as the final fantasy victory themes or Pokemon battle themes. I expect to either create some sort of full orchestral piece with brass, woodwinds, and strings or I may make my life simpler by focusing on one instrument as my main focus with other supporting instruments.My biggest difficulty I foresee is being able to create a catchy 'jingle' like melody if the purpose would be to have it loop at least ~2-3 in a single stage or battle. snap.berkeley.edu For my final project I want to create a game that is similar to mario, so the player can move left, right, and jump, and there will be a scrolling screen. It will be a platformer and in order to win, the player will have to cross the finish line at the end. I will use my sprites from the animation assignment and the player will have an attack ability. They player will start with three lives and there will be enemies within the game that can harm the player. If the player loses all three lives before reaching the end, they will lose. I hope to implement two different kinds of enemies. One type that is stationary (like platforms that can harm the player if they land on it) and more active/moving enemies. I imagine adding moving enemies will be the most difficult part of this idea. For my final project, I want to create a side-scrolling game where they have to avoid objects. The player will have the ability to move up and down using their mouse to avoid objects. They will get three chances (lives) in case they run into an object. Once all the lives are lost, the game ends. I want my game to be similar to "Flappy Bird" where a bird (the sprite) avoids the green pipes but instead of using the space bar to jump, the player uses their mouse.I think my most difficult part will be implementing the three lives and the addition of new objects from the side scrolling.
