Google AI Credits are used for various activities, but they're considered spent once used. If an AI tool fails, remaining credits won't be affected, but there might be a delay before reappearing. Each model uses different amounts of credits; learn how AI Credits work. Certain users aren't eligible to use AI Credits: those under 18 and Google One members subscribed through third parties or Apple billing. You can check your total remaining AI Credits and activity through Whisk and Flow. You'll be notified if you're low on credits, don't have enough for a request, or are out of credits for the month. To review credit usage, check "AI Credits activity," which shows information like timestamp, category (Whisk, Flow), amount (subtractions and additions), and shareable data. You can now share AI Credits with your family group. When a plan manager purchases Google AI Pro or Ultra membership and turns on family sharing, the family group gets access to benefits, including shared storage space and credits. However, only the plan manager can buy additional credits, upgrade, or downgrade memberships. AI Credit costs are per generation, not per request. For example, Flow's Veo 2 - Fast generates two videos per request, using 10 AI Credits each. Google AI Pro offers 1,000 monthly credits, while Ultra provides 25,000. Top-up AI Credits are available to Ultra and Pro members; they're valid for 12 months from the last purchase. Members of a family group can't purchase top-up credits separately; only the plan manager can buy additional credits or upgrade/downgrade memberships. If you cancel Ultra membership after buying top-up credits, any remaining credits can be used in the Google AI Pro plan. You can find your device's Android version number and security update status by checking your Settings app. You'll get notifications when updates are available for your device. To check for updates: open your device's Settings app, tap System Software updates (or Google Play system update), and follow on-screen instructions. If an update starts downloading but doesn't finish, your device will automatically try again over the next few days. Make sure you have enough space to run newer Android versions; otherwise, install downloaded updates manually. To get the latest security update, ensure you have the latest Android version available for your device. Pro capabilities in NotebookLM offer an enhanced experience with features like one-click summaries, FAQs, timelines, and briefing docs, as well as 5x more Audio Overviews, Video Overviews, notebooks, queries, and sources per notebook. With NotebookLM, you get 100 notebooks, each with up to 50 sources (up to 500K words each), and daily limits of [insert numbers]. NotebookLM in Google AI Pro or Ultra offers enhanced capabilities for users. The Pro version allows up to 500 notebooks with 300 sources each and 500 daily chat queries, while the Ultra plan provides an additional boost, increasing these limits to even more substantial numbers. Users can also share "Chat-only" notebooks with others, giving them access to the entire notebook or just the chat functionality. Customization options are available in NotebookLM, including advanced chat settings that enable users to choose a response style and output length. Additionally, users can view analytics on their notebook's usage, such as the number of daily users and queries made. Notebook upgrades are also available through Google Cloud or work/school accounts, offering expanded access to features and models in Gemini Apps. To use these upgrades, users must meet certain age requirements and be part of a supported country or region. You can upload and manage your conversations with Gemini, and the app will notify you when you're close to reaching your chat capacity for a given period. Gemini models have different limitations on how many prompts and chats you can have before hitting the cap, and there are more advanced models available that allow for greater limits. If you reach the limit of a specific model within a certain time frame, you can switch to a different model until the limit is reached or wait until it's refreshed. Users with Google AI Pro or Google AI Ultra plans have higher chat capacity limits on advanced models. ###ARTICLE
